► THE CHALLENGE

Many voices, one decision

Writing new drinking water policy requires aligning provinces, municipalities, water boards and universities — all at the same table.

Each stakeholder is fixed on their own criteria. The reasoning behind each position stays hidden — making shared decisions slow and fragmented.

Our tool helps policy makers prepare meetings, streamline conversations, and ground decisions in objective data.

From fragmented opinions to shared scenarios

Today

Every stakeholder
has their own lens

I sit at the table with the province, the water board, and the municipality. Every party defends their position — but the reasoning behind it stays invisible to everyone else.

The problem

Hidden reasoning
breaks alignment

Without a shared framework, discussions become circular. Trade-offs are unclear, assumptions go untested, and decisions lack the objective grounding needed for robust water policy.

Our solution

Scenario Simulator:
Water World

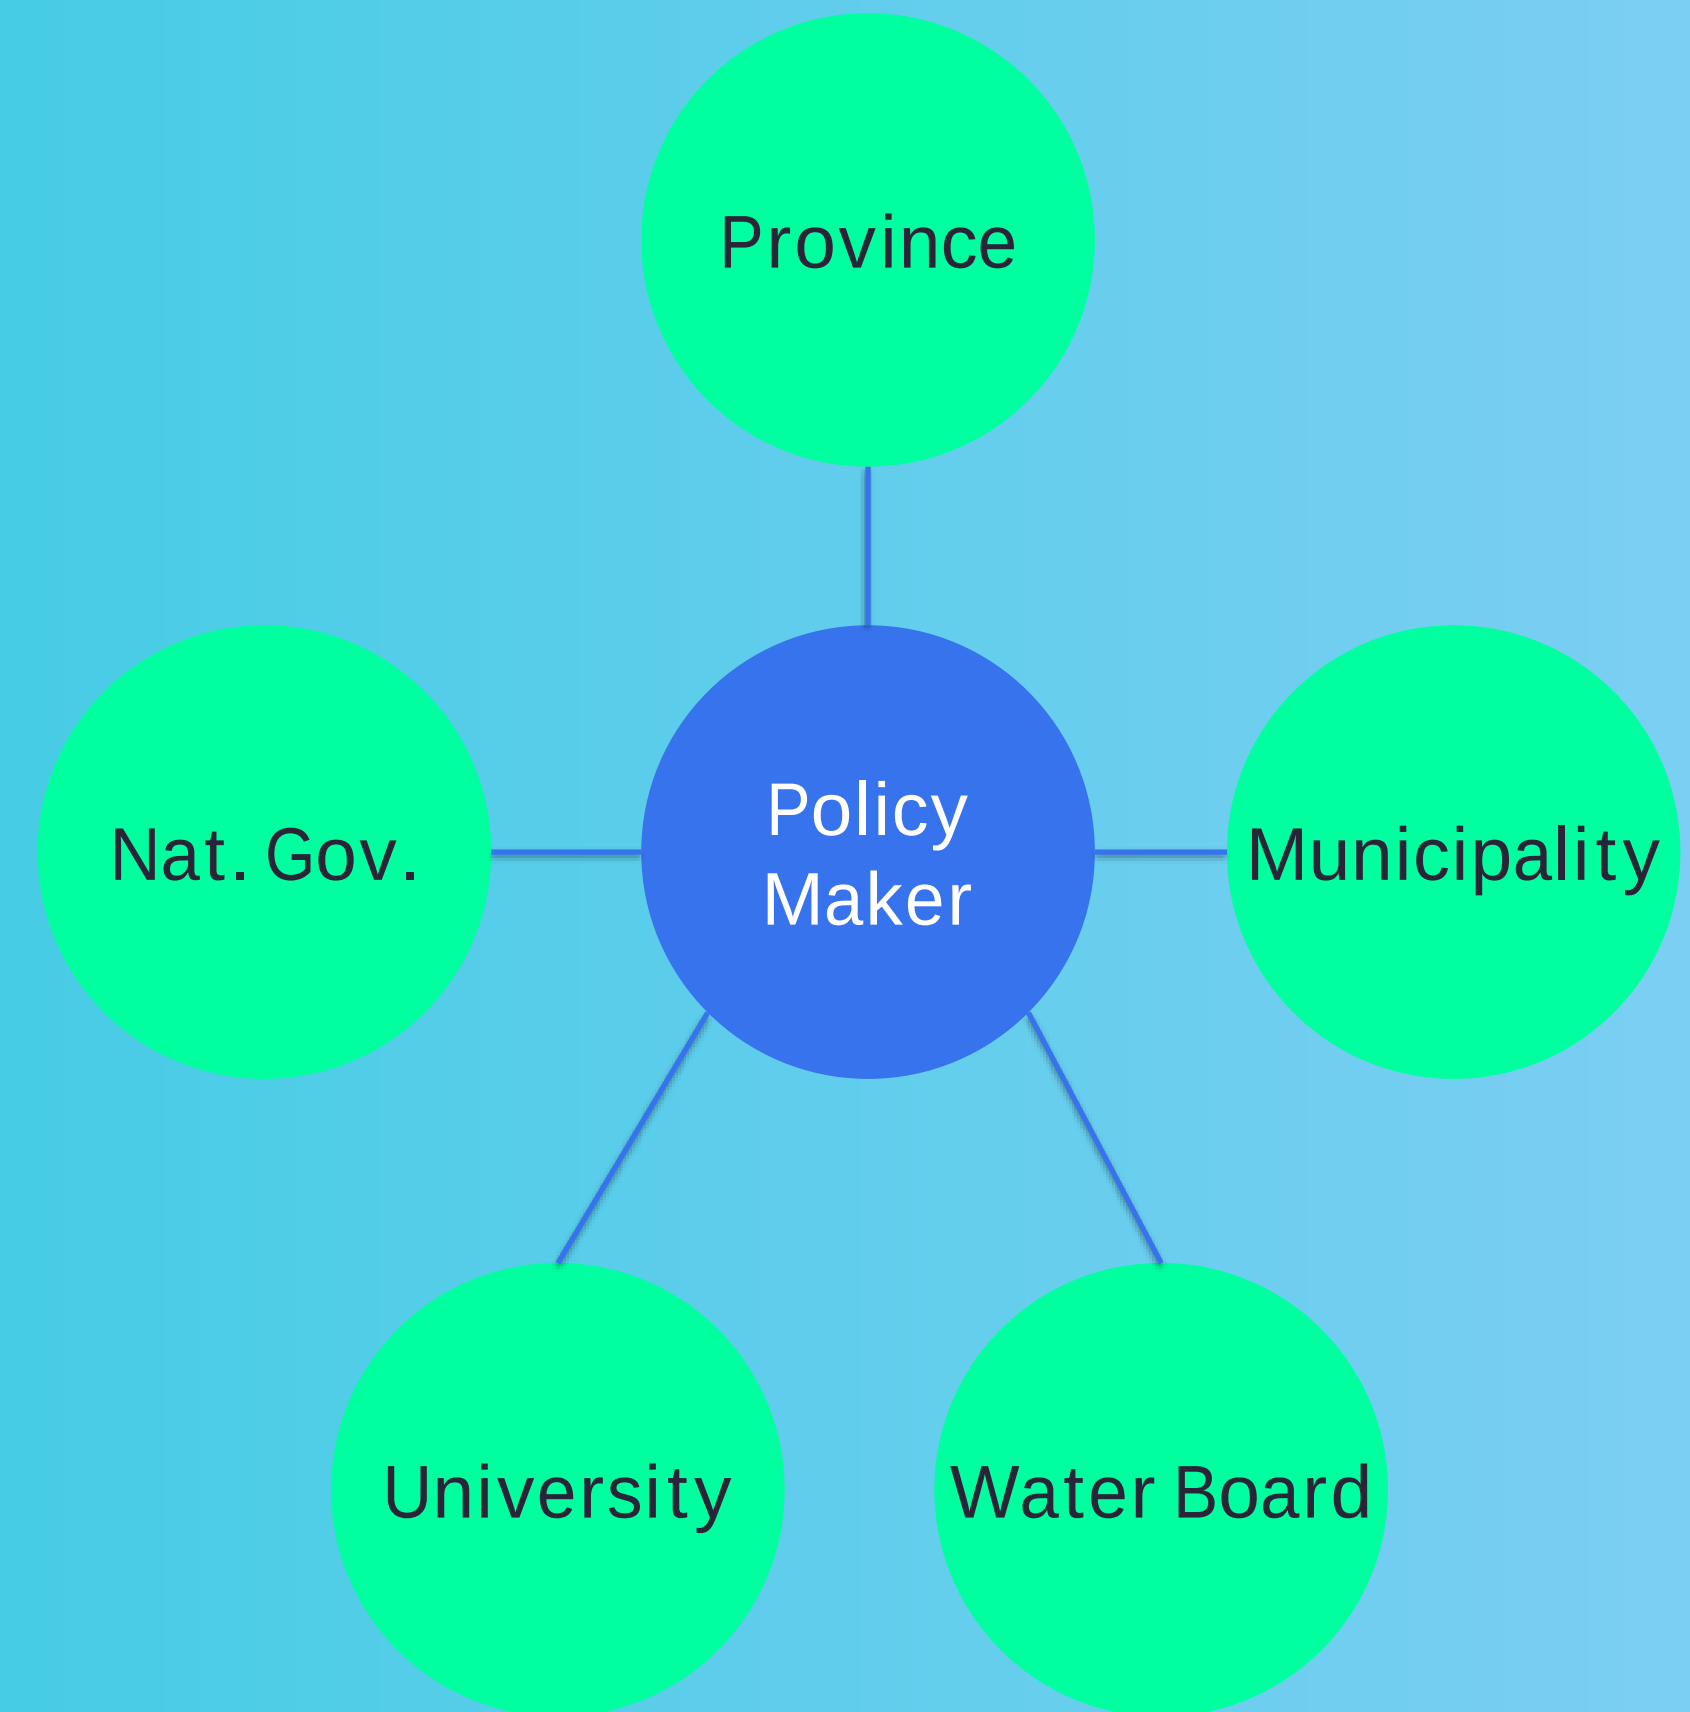

A tool that shifts the conversation from fixed positions to shared scenarios. Stakeholders explore what-if futures together, backed by objective data — streamlining decisions and building

► THE CHALLENGE

Many voices, one decision

- Writing new drinking water policy requires aligning provinces, municipalities, water boards and universities.
- Each stakeholder has their own perspective. A lot of information is in heads, making shared decisions slow and fragmented.

Our tool helps policy makers prepare meetings, streamline conversations, and ground decisions in objective data.

NEXT STEPS OVERVIEW

01

Stakeholder Alignment

Identify decision-makers at PZH, GovTechNL, and partner organisations. Define governance and ownership before development continues.

02

What's Needed

Map resource requirements: data access, cloud infra, capacity, legal (Woo/AVG), and open source maintenance responsibilities.

03

Assumptions & Risks

Document key assumptions made during the hackathon. Identify data gaps, model limitations, and regulatory constraints to address.

04

Validation

Test scenario outputs with domain experts (waterschap, PZH beleidsmakers). Verify data sources, model logic, and interpretability.

05

Minimal Viable Product

Define MVP scope: which scenarios, which datasets, which user interactions. Separate core from nice-to-have features.

06

Roadmap & Timeline

Phase the work from validated PoC to production-ready tool. Set milestones, assign ownership, and agree on a review cadence.
